Mail Stop Patent Application

Commissioner for Patents

P.O. Box 1450

Alexandria, VA 22313-1450

Presented for filing is a new patent application claiming priority from a provisional patent application of:

Applicant: MICHAEL D. SCHUSTER

BOSTON DALLAS

Title:

DECOMPOSING NATURAL IMAGE SEQUENCES

DELAWARE

NEW YORK

Enclosed are the following papers, including those required to receive a filing date under 37 CFR §1.53(b):

SAN DIEGO

SILICON VALLEY

TWIN CITIES WASHINGTON, DC

	Pages
Specification	18
Claims	9
Abstract	1
Declaration	1
Drawing(s)	7

## Enclosures:

- Request and Certification Under 35 U.S.C. 122(b)(2)(B)(i) (1 page)
- Application Coversheet, (1 page)
- Postcard.

Under 35 USC §119(e)(1), this application claims the benefit of prior U.S. provisional application 60/421,269, filed October 25, 2002.

Basic filing fee	\$750
Total claims in excess of 20 times \$18	\$378
Independent claims in excess of 3 times \$84	\$168
Fee for multiple dependent claims	\$0
Total filing fee:	\$1296

#### **BACKGROUND**

The present invention relates to representing and analyzing sequences of images of a natural scene.

It has been proposed that natural images can be described in terms of intrinsic characteristics, such as range, orientation, reflectance, and incident illumination of the surface element visible at each point in the image. H.G. Barrow & J.M. Tenenbaum, Recovering intrinsic scene characteristics from images, in A. Hanson & E. Riseman, editors, Computer Vision Systems, Academic Press (1978). The extraction of information describing such characteristics is complicated, however, by the fact that the information representing the combined characteristics for each pixel in an image is confounded in a single pixel value representing the intensity of light captured for the corresponding location. The decomposition of these pixel values to obtain information corresponding to intrinsic characteristics depends on the introduction of constraints derived from assumptions about the scene and the imaging process.

In one approach to the problem of decomposing an image sequence including t images into constant reflectance and varying illumination such that:

$$I' = RL' \qquad (1)$$

the images I' are first transformed into the log domain where their compositions as component-wise products of reflectance and illumination are replaced by component-wise sums of corresponding logged terms:

$$i' = r + l' \quad (2)$$

where i', r, and I' denote the logs of I', R, and L'.

Vertical and horizontal derivative filters  $f_1$  and  $f_2$  are then applied to i':

$$i_n^t = r_n + l_n^t$$
